1.3 MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

Measurement uncertainty	
Radiated Emissions (UE)	$\pm 2.1618\text{dB}$
Control and Monitoring Functions (UE)	$\pm 2.5992\text{dB}$
Transmitter maximum output power	$\pm 0.651\text{dB}$
Transmitter spectrum emissions mask	$\pm 1.198\text{dB}$
Transmitter spurious emissions	$\pm 1.427\text{dB}$
Transmitter Minimum output power	$\pm 0.651\text{dB}$
Receiver Adjacent Channel Selectivity(ACS)	$\pm 0.964\text{dB}$
Receiver Blocking characteristics	$\pm 0.967\text{dB}$
Receiver intermodulation characteristics	$\pm 1.075\text{dB}$
Receiver spurious emissions	$\pm 1.427\text{dB}$
Transmitter adjacent channel leakage power ratio	$\pm 1.960\text{dB}$
Receiver Reference Sensitivity Level	$\pm 0.967\text{dB}$

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=2$.

Only the measured values related to their corresponding limits will be used to decide whether the equipment under test meets the requirements of the test standards listed.

The measurement uncertainty is mentioned in this test report, but is not taken into account - neither to the limits nor to the measurement results. Measurement results with a smaller margin to the corresponding limits than the measurement uncertainty have a potential risk of more than 5% that the decision might be wrong.
